- Summary, an epilogue and conclusions.

## The 802.11 DCF

Figure: 802.11 MAC operation

## Popular mathematical modeling approaches

- **P-persistent**: approximate the back-off distribution by a geometric with the same mean. E.g. work by Marco Conti and co-authors (F Cali, M Conti, E Gregori, P Aleph IEEE/ACM ToN 2000).
- **Mean-field Markov models**: seminal work by Bianchi (IEEE Comms L. 1998, IEEE JSAC 2000).

## Bianchi's approach

**Observation:** each individual station's impact on overall network access is small.

## Bianchi's approach

**Observation:** each individual station's impact on overall network access is small.

**Mean field approximation:** assume a fixed probability of collision at each attempted transmission  $p$ , irrespective of the past.

## Bianchi's approach

**Observation:** each individual station's impact on overall network access is small.

**Mean field approximation:** assume a fixed probability of collision at each attempted transmission  $p$ , irrespective of the past.

Each station's back-off counter then a **Markov chain**.

## Mean-field Markov Model's Chain

Figure: Individual's Markov Chain if  $p$  known

Navigation icons: back, forward, search, etc.

## Mean-field Markov Overview

Stationary distribution gives the probability the station attempts transmission in a typical slot

Navigation icons: back, forward, search, etc.

## Mean-field Markov Overview

Stationary distribution gives the probability the station attempts transmission in a typical slot

$$\tau(p) = \frac{2(1-2p)}{(1-2p)(W+1) + pW(1-(2p)^m)}$$

Navigation icons: back, forward, search, etc.

## Mean-field Markov Overview

Stationary distribution gives the probability the station attempts transmission in a typical slot

$$\tau(p) = \frac{2(1-2p)}{(1-2p)(W+1) + pW(1-(2p)^m)}$$

Figure: Attempt probability  $\tau(p)$  vs  $p$

Navigation icons: back, forward, search, etc.

## The self-consistent equation

Network of  $N$  stations.

## The self-consistent equation

Network of  $N$  stations. Mean field decoupling idea:

## The self-consistent equation

Network of  $N$  stations. Mean field decoupling idea: the impact of **every** station on the network access of the others is small,

## The self-consistent equation

Network of  $N$  stations. Mean field decoupling idea: the impact of **every** station on the network access of the others is small, so that

$$1 - p = (1 - \tau(p))^{N-1}. \quad (1)$$

Solution of equation (1) determines the network's "real"  $p^*$ .

## The self-consistent equation

Network of  $N$  stations. Mean field decoupling idea: the impact of **every** station on the network access of the others is small, so that

$$1 - p = (1 - \tau(p))^{N-1}. \quad (1)$$

Solution of equation (1) determines the network's "real"  $p^*$ .

Figure:  $1 - p$  and  $(1 - \tau(p))^N$  for  $N = 2, 4, 8$  &  $16$

Navigation icons: back, forward, search, etc.

## Example developments

- **Unsaturated 802.11, Small buffer:** Ahn, Campbell, Veres and Sun, IEEE Trans. Mob. Comp., 2002; Ergen, Varaiya, ACM-Kluwer MONET, 2005; Malone, K.D., Leith, IEEE/ACM Trans. Network., 2007.

Navigation icons: back, forward, search, etc.

## Example developments

- **Unsaturated 802.11, Small buffer:** Ahn, Campbell, Veres and Sun, IEEE Trans. Mob. Comp., 2002; Ergen, Varaiya, ACM-Kluwer MONET, 2005; Malone, K.D., Leith, IEEE/ACM Trans. Network., 2007.
- **Unsaturated 802.11, Big buffer:** Cantieni, Ni, Barakat and Turletti, Comp. Comm., 2005; Park, Han and Ahn, Telecomm. Sys., 2006; K.D. and Ganesh, IEEE Comm. Lett., 2007.

## Example developments

- **Unsaturated 802.11, Small buffer:** Ahn, Campbell, Veres and Sun, IEEE Trans. Mob. Comp., 2002; Ergen, Varaiya, ACM-Kluwer MONET, 2005; Malone, K.D., Leith, IEEE/ACM Trans. Network., 2007.
- **Unsaturated 802.11, Big buffer:** Cantieni, Ni, Barakat and Turletti, Comp. Comm., 2005; Park, Han and Ahn, Telecomm. Sys., 2006; K.D. and Ganesh, IEEE Comm. Lett., 2007.
- **802.11e, Saturated:** Kong, Tsang, Bensaou and Gao, IEEE JSAC, 2004; Robinson and Randhawa, IEEE JSAC, 2004.  
**Unsaturated:** Zhai, Kwon and Fang, WCMC, 2004. Chen, Xhai, Tian and Fang, IEEE Trans. W. Commun., 2006.

## Example developments

- **Unsaturated 802.11, Small buffer:** Ahn, Campbell, Veres and Sun, IEEE Trans. Mob. Comp., 2002; Ergen, Varaiya, ACM-Kluwer MONET, 2005; Malone, K.D., Leith, IEEE/ACM Trans. Network., 2007.
- **Unsaturated 802.11, Big buffer:** Cantieni, Ni, Barakat and Turetli, Comp. Comm., 2005; Park, Han and Ahn, Telecomm. Sys., 2006; K.D. and Ganesh, IEEE Comm. Lett., 2007.
- **802.11e, Saturated:** Kong, Tsang, Bensaou and Gao, IEEE JSAC, 2004; Robinson and Randhawa, IEEE JSAC, 2004. **Unsaturated:** Zhai, Kwon and Fang, WCMC, 2004. Chen, Xhai, Tian and Fang, IEEE Trans. W. Commun., 2006.
- **802.11s, unsaturated:** K.D., Leith, Li and Malone, IEEE Comm. Lett., 2006.

## Standard approach to model verification

**ASK:** Do the model throughput and delay predictions match well with results from simulated system?

## Standard approach to model verification

**ASK:** Do the model throughput and delay predictions match well with results from simulated system?

**NOT:** Make the approximations explicit hypotheses and check them directly.

## A warning from hydrology

*"The modelling technology has far outstripped the level of our understanding of the physical processes being modeled. Making use of this technology then requires that the gaps in the factual knowledge be filled with assumptions which, although often appearing logical, have not been verified and may sometimes be wrong".*

*Vit Klemes, WCP-98, WHO, 1985.*

## Test bed

Figure: PC as AP, 1 PC and 9 PC-based Soekris Engineering net4801 as clients. All with Atheros AR5215 802.11b/g PCI cards. Modified MADWiFi wireless driver for fixed 11 Mbps transmissions and specified queue-size.

## What are the hypotheses?

All models:

- $C_k = 1$  if  $k^{\text{th}}$  transmission results in collision.

## What are the hypotheses?

All models:

- $C_k = 1$  if  $k^{\text{th}}$  transmission results in collision.
- $C_k = 0$  if  $k^{\text{th}}$  transmission results in success.

## What are the hypotheses?

All models:

- $C_k = 1$  if  $k^{\text{th}}$  transmission results in collision.
- $C_k = 0$  if  $k^{\text{th}}$  transmission results in success.

Assumptions:

- (A1)  $\{C_k\}$  is an independent sequence;

## What are the hypotheses?

All models:

- $C_k = 1$  if  $k^{\text{th}}$  transmission results in collision.
- $C_k = 0$  if  $k^{\text{th}}$  transmission results in success.

Assumptions:

- (A1)  $\{C_k\}$  is an independent sequence;
- (A2)  $\{C_k\}$  are identically distributed with  $P(C_k = 1) = p$ .

Navigation icons: back, forward, search, etc.

## Testing (A1): $\{C_k\}$ independent

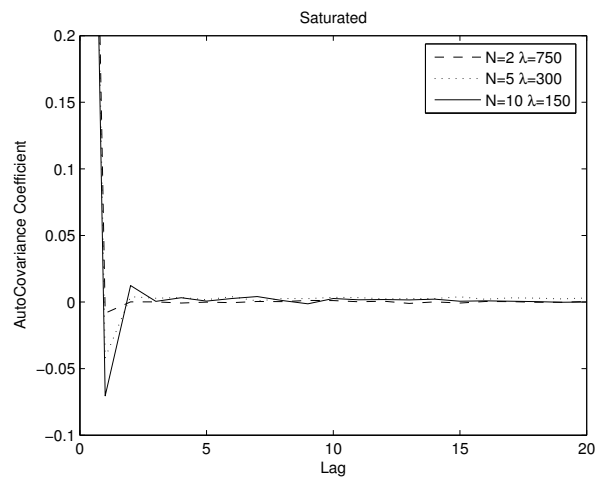

Figure: Saturated  $C_1, \dots, C_K$  normalized auto-covariances. Experimental data,  $N = 2, 5, 10$ ,  $K = 2500k, 1200k, 711k$ .

Navigation icons: back, forward, search, etc.

## Testing (A1): $\{C_k\}$ independent

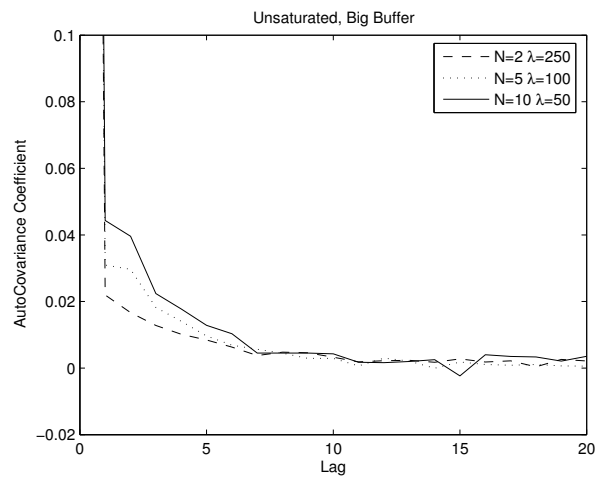

Figure: Unsaturated, big buffer  $C_1, \dots, C_K$  normalized auto-covariances. Experimental data,  $N = 2, 5, 10$ ,  $K = 1800k, 750k, 380k$ .

Navigation icons: back, forward, search, etc.

## Testing (A2): $\{C_k\}$ identically distributed

Record the backoff stage at which the attempt was made.  
Probability  $p_i$  of collision given backoff stage  $i$ .

Navigation icons: back, forward, search, etc.

## Testing (A2): $\{C_k\}$ identically distributed

Record the backoff stage at which the attempt was made.

Probability  $p_i$  of collision given backoff stage  $i$ .

Assumption (A2):  $p_i = p$  for all  $i$ .

## Testing (A2): $\{C_k\}$ identically distributed

Record the backoff stage at which the attempt was made.

Probability  $p_i$  of collision given backoff stage  $i$ .

Assumption (A2):  $p_i = p$  for all  $i$ .

MLE

$$\hat{p}_i = \frac{\text{\#collisions at back-off stage } i}{\text{\#transmissions at back-off stage } i}$$

## Testing (A2): $\{C_k\}$ identically distributed

Record the backoff stage at which the attempt was made.

Probability  $p_i$  of collision given backoff stage  $i$ .

Assumption (A2):  $p_i = p$  for all  $i$ .

MLE

$$\hat{p}_i = \frac{\text{\#collisions at back-off stage } i}{\text{\#transmissions at back-off stage } i}$$

Hoeffding's inequality (1963):

$$P(|\hat{p}_i - p_i| > x) \leq 2 \exp(-2x(\text{\#transmissions at back-off stage } i)).$$

To have 95% confidence that  $|\hat{p}_i - p_i| \leq 0.01$  requires 185 attempted transmissions at backoff stage  $i$ .

Navigation icons: back, forward, search, etc.

## Testing (A2): $\{C_k\}$ identically distributed

Figure: Saturated collision probabilities. Experimental data.

Navigation icons: back, forward, search, etc.

## Testing (A2): $\{C_k\}$ identically distributed

Figure: Unsaturated, big buffer collision probabilities. Experimental data.

## What are the big-buffer hypotheses?

Big-buffer models:

- $Q_k = 1$  if packet waiting after  $k^{\text{th}}$  successful transmission.

## What are the big-buffer hypotheses?

Big-buffer models:

- $Q_k = 1$  if packet waiting after  $k^{\text{th}}$  successful transmission.
- $Q_k = 0$  if no packet waiting after  $k^{\text{th}}$  successful transmission.

## What are the big-buffer hypotheses?

Big-buffer models:

- $Q_k = 1$  if packet waiting after  $k^{\text{th}}$  successful transmission.
- $Q_k = 0$  if no packet waiting after  $k^{\text{th}}$  successful transmission.

Assumptions:

- (A3)  $\{Q_k\}$  is an independent sequence;

## What are the big-buffer hypotheses?

Big-buffer models:

- $Q_k = 1$  if packet waiting after  $k^{\text{th}}$  successful transmission.
- $Q_k = 0$  if no packet waiting after  $k^{\text{th}}$  successful transmission.

Assumptions:

- (A3)  $\{Q_k\}$  is an independent sequence;
- (A4)  $\{Q_k\}$  are identically distributed with  $P(Q_k = 1) = q$ .

Navigation icons: back, forward, search, etc.

## Testing (A3): $\{Q_k\}$ independent

Figure: Unsaturated, big buffer queue-non-empty sequence normalized auto-covariances. Experimental data.  $K = 1700k, 720k, 360k$ .

Navigation icons: back, forward, search, etc.

## Testing (A4): $\{Q_k\}$ identically distributed

Figure: Unsaturated, big buffer queue-non-empty probabilities. Experimental data. (Note the large y-range!)

Navigation icons: back, forward, search, etc.

## What are the 802.11e hypotheses?

Models with different AIFS values:

- $H_k$  is length of  $k^{\text{th}}$  stuck in a hold-state.

Navigation icons: back, forward, search, etc.

## What are the 802.11e hypotheses?

Models with different AIFS values:

- $H_k$  is length of  $k^{\text{th}}$  stuck in a hold-state.

Assumptions:

- (A5)  $\{H_k\}$  is an independent sequence;

## What are the 802.11e hypotheses?

Models with different AIFS values:

- $H_k$  is length of  $k^{\text{th}}$  stuck in a hold-state.

Assumptions:

- (A5)  $\{H_k\}$  is an independent sequence;
- (A6)  $\{H_k\}$  are identically distributed with a distribution that can be determined from a stopping time problem.

## Testing (A5): $\{H_k\}$ independent

Figure: Hold state normalized auto-covariances. 5 class 1, 5 class 2 stations,  $D = 2, 4 \& 8$ .  $K = 1700k, 1200k, 850k$ . ns-2 data

Navigation icons: back, forward, search, etc.

## Testing (A6): $\{H_k\}$ specific distribution

Figure: Hold state distributions,  $D = 2, 12$ . ns-2 data.

Navigation icons: back, forward, search, etc.

## Testing (A6): $\{H_k\}$ specific distribution

Figure: Hold state distributions,  $D = 2, 12$ . ns-2 data.

Kolmogorov-Smirnov test accepts fit for  $K$  of the order 10,000;

## Testing (A6): $\{H_k\}$ specific distribution

Figure: Hold state distributions,  $D = 2, 12$ . ns-2 data.

Kolmogorov-Smirnov test accepts fit for  $K$  of the order 10,000;  
rejects it for  $K$  of the order 1,000,000.

## What are the 802.11s hypotheses?

Mesh model(s) assume:

- $D_k$  is  $k^{\text{th}}$  inter-departure time.

## What are the 802.11s hypotheses?

Mesh model(s) assume:

- $D_k$  is  $k^{\text{th}}$  inter-departure time.

Assumptions:

- (A7)  $\{D_k\}$  is an independent sequence;

## What are the 802.11s hypotheses?

Mesh model(s) assume:

- $D_k$  is  $k^{\text{th}}$  inter-departure time.

Assumptions:

- (A7)  $\{D_k\}$  is an independent sequence;
- (A8)  $\{D_k\}$  are exponentially distributed.

## Summary

Assumption	Sat.	Small buf.	Big buf.
